

Image Sizing and CSS Properties.

The goal of this project is to create a set of CSS rules that improve the display of images in an HTML page. It is related to the first Drag and Drop project, and utilizes the same markup.

The desired features:

1. The image should have its height and width track with window resizing. Perhaps this can be done with a combination of percentage settings for height, width, and the min, and max properties? Ideally we would like this to be implemented with a set of CSS rules, but if that is not possible, we can revert to a jQuery solution.
2. As the image changes, with resize, the aspect ratio must remain the same as the original.
3. On mouse over, a small popup should appear, with a file upload control (for cases where drag and drop are not viable). The submission of this form should follow the same details as the earlier drag and drop project, and this project may be added as an extension to that one. If it is an extension, it should be a configurable option.
